Moderate

## Patient Details

Name: sdjfuaes welkfkEW

Age: 3 Gender: Male

## Treatment Recommendations:

- 0: Surgery: Consider surgical resection of the glioma if feasible.
- 1: Radiation therapy: Use adjuvant radiation therapy to target residual tumor cells.
- 2: Chemotherapy: Administer chemotherapy agents to help manage glioma.
- 3: Rehabilitation: Implement rehabilitation services to assist recovery post-stroke.

## Possible Causes:

- 0: Genetic predisposition: Family history of gliomas or other brain tumors.
- 1: Environmental factors: Exposure to radiation or certain chemicals.
- 2: Vascular issues: Underlying vascular abnormalities leading to stroke.

## Recommended Blood Tests:

- 0: Complete blood count (CBC): To assess overall health and detect infections.
- 1: Electrolytes panel: To check for electrolyte imbalances that may affect neurological function.
- 2: Tumor markers: To identify specific markers associated with glioma.

## Prescriptions:

- 0: Dexamethasone: To reduce swelling and inflammation around the tumor.
- 1: Temozolomide: An oral chemotherapy medication for glioma treatment.
- 2: Anticoagulants: To prevent further stroke events in the patient.
