Moderate

Patient Details

Name: Rahul Dewani

Age: 34 Gender: Male

Treatment Recommendations:

- Psychosocial Support:** Provide counseling and support for alcohol abuse.
- Radiation Therapy:** Administer radiation therapy to target glioma cells.
- Rehabilitation Therapy:** Implement a rehabilitation program post-stroke.
- Surgical Intervention:** Consider surgical resection of glioma if feasible.

Possible Causes:

- Alcohol Abuse:** Chronic alcohol consumption can lead to neurological complications.
- Environmental Exposures:** Exposure to certain chemicals or radiation may increase glioma risk.
- Genetic Factors:** Certain genetic predispositions may contribute to glioma development.

Recommended Blood Tests:

- Complete Blood Count (CBC):** To assess overall health and detect various disorders.
- Liver Function Tests:** To evaluate liver health, especially in relation to alcohol abuse.
- Tumor Markers:** To detect specific markers associated with glioma.

Prescriptions:

- Anticonvulsants:** To prevent seizures which can occur post-stroke and with glioma.
- Antidepressants:** To help manage mood and anxiety associated with stroke recovery.
- Nutritional Supplements:** For supporting recovery and general health.
